

## Spring Energy Saving Tips

### The Cooling Challenge

It is hard to imagine, but this long winter will soon be a distant memory and before you know it, the hot summer days will be upon us. Along with the summer sun will be the need to turn on your air conditioner or purchase a new one. As cooling can account for up to 17% of your annual energy costs, making the right choices about tune ups and purchases can greatly affect your wallet.

**Window units** can be effective if sized properly to fit the room it is cooling. If you need to purchase a unit, be sure it is ENERGY STAR certified as they use 10% less energy than the standard models.

Looking for a **new central air unit** or need to upgrade your old inefficient one? If your current system is over 12 years old, upgrading to a new ENERGY STAR model could cut your cooling costs by as much as 30%, thanks to more efficient technologies. Wesson can work with you to determine your needs and size the new unit to fit your home.

If your unit is less than 12 years old, be sure that you are having it **tuned up annually**, before the summer demand begins. Wesson can provide a 15-step annual check-up and tuning service on your unit to ensure it is running as efficiently as possible. Call us today to schedule your appointment.

### Cool Rebates

If you are in the market for a new central air conditioner unit or considering the installation of a ductless heat pump in lieu of window units, Wesson can provide you with rebate information available for customers who participate in the *Home Energy Solutions* program. These rebates, as well as low interest loans, are most generous but you must participate in the *Home Energy Solutions* program to determine eligibility. You can learn more about this program by [clicking here](#). Or call us at 203-756-7041.

Whether you use window air conditioners (left) or a central air unit (right), your cooling costs can be up to 17% of your annual energy costs.
